PROFESSIONAL SUMMARY

I am a principal-level AI engineer and technical lead with more than six years of experience architecting and shipping production AI platforms, from LLM and agentic systems through to full-stack Django engineering. At PySquad I grew a cross-functional team from 5 to 16 people and delivered over 15 projects under my technical direction, taking ownership of architecture standards, tech-stack decisions, and engineering quality. My hands-on work centers on LLM fine-tuning, RAG, and multi-agent pipelines. I have also published two open-source Django libraries.

TECHNICAL SKILLS

GenAI & LLMs - LLM fine-tuning (Llama 3.2, LoRA, Unsloth), RAG pipelines, agentic AI, multi-agent orchestration, prompt engineering, tool and function calling, Ollama and local inference, Gemini, OpenAI

AI & ML - NLP, predictive intelligence, trust and risk scoring engines, PySpark, Pandas, model evaluation, data engineering

Backend - Python, Django 5.x, Django REST Framework, FastAPI, Flask, REST API design, Celery

Architecture - Multi-tenant SaaS (shared-schema), white-label platforms, event-driven design, microservice patterns, system and solution architecture

Data & Storage - PostgreSQL, pgvector, PostGIS, MongoDB, Redis, Elasticsearch, MySQL

DevOps & Cloud - Docker, Kubernetes, CI/CD (GitHub Actions, Terraform), AWS, Linux and Ubuntu server deployment

Technical Leadership - Architecture standards, tech-stack selection, code review, mentoring, hiring and technical interviewing, team scaling, roadmap execution

EXPERIENCE

Tech Lead (Python/AI) at PySquad Informatics LLP

07/2021 to Present

- Grew a cross-functional team from 5 to 16 people across backend, frontend, AI, and QA, and delivered more than 15 products under my technical direction.
- Set the architecture standards and owned tech-stack and framework selection across concurrent AI product engagements.
- Ran hiring and technical interviews, and mentored junior engineers into stronger, higher-ownership roles.
- Architected multi-agent AI pipelines and RAG systems, including autonomous SDR agents, trust-scoring engines, buying-signal detection, and knowledge assistants.
- Designed multi-tenant, white-label SaaS platforms with shared-schema tenancy, module-gated access, and per-tenant theming.
- Fine-tuned and deployed LLMs (Llama 3.2 on a Hinglish dataset using LoRA and Unsloth) and set up local inference with Ollama.
- Drove repeat business and higher delivery quality through consistent engineering standards, and contributed to pricing and go-to-market strategy.

Software Engineer at Treesha Infotech

06/2020 to 06/2021

- Built and maintained Python and Django backend systems, REST APIs, and third-party and payment gateway integrations.
- Delivered POS and e-commerce modules, from requirement analysis through to UAT deployment.

EDUCATION & LEARNING

Bachelor of Engineering (B.E.) - Gujarat Technological University (GTU)

FLAGSHIP PROJECTS

NIVA (getniva.ai)

An aviation and logistics conversational AI platform with more than 100 paying users. I led the architecture and delivery, including a 102-entry use-case library, a four-tier pricing model, and white-label bot personas, and I designed the internal ISPIA architecture framework behind it.

AscentPassport (ascentpassport.com)

An AI employment verification platform that has processed more than 10,000 verifications at around 80 percent verification accuracy. I designed the AP Score trust engine and a multi-agent pipeline covering risk scoring, HR outreach, and tool-calling agents that integrate GitHub, MCA, GST, EPFO, and DNS sources, with OTP-verified onboarding.

ZingTMS (zingtms.com)

A white-label, multi-tenant Transportation Management System with plug-and-play logistics modules on a shared-schema Django base, a unified event stream, and Celery and Redis async processing. I owned the core architecture and the multi-tenancy model.

Airtel (Airtel.in)

I worked on Airtel's FTTH (Fiber to the Home) system, handling the Python-side development and delivery ownership across a large-scale Indian subscriber database. I managed server operations alongside the team and was responsible for the Python workstreams and on-time delivery of the components we owned.

NOTABLE CONTRIBUTIONS

Focused, module-level work on external AI products:

Predictores.ai (predictores.ai)

I built the Predictive Campaign Generation module for a human-supervised decision-intelligence platform that turns business and audience signals into explainable next-best-actions.

CareNav (carenavindia.ai)

I built AI-based document handling and process-automation workflows for a hospital insurance-claims platform (ABDM-compliant, FHIR R4), which brought a three-hour manual process down to roughly twenty minutes.

OPEN SOURCE

Published, MIT-licensed Python libraries on PyPI:

django-graphify (PyPI, v0.1.1, Beta) [PyPI](#) · [GitHub](#)

A zero-LLM knowledge graph for Django projects. It inspects models, views, URLs, signals, serializers, admin classes, middleware, and settings fully offline, and generates interactive HTML, Mermaid, Markdown, JSON, and Cypher graph exports.

django-compliance-shield (PyPI, v1.1.0, Stable) [PyPI](#) · [GitHub](#)

A drop-in Django library for global privacy compliance. A single decorator delivers DPDP, GDPR, CCPA, and FCRA compliance with field-level encryption, consent management, DSR tracking, breach notification, and data retention out of the box.

COMMUNITY & EARLIER WORK

- I create AI and GenAI content on LinkedIn for an audience of more than 8,500 followers, publishing applied AI, ML, and GenAI technical writing.
- I worked at RynoWallet (rynowallet.com), a coalition loyalty wallet for independent local shops, where I own the product, architecture, and roadmap.
- Earlier Python engineering work includes ChargeSavvy (a multi-location POS across the UK and USA, with web and iOS clients), Zast Solutions (a logistics platform), and TDS Reconciliation (built with PySpark, Flask, and Power BI).
